

Something somewhat unique to the tabbing environment is that you can also add or subtract vertical space at the end of any line by putting in a length in brackets. Here is an example of that:

Named Input	Description
<code>data</code>	SAS name for the dataset,
<code>raw</code>	variable containing data,
<code>converge</code>	λ^{-1} (default 10^{-6}),
<code>maxiter</code>	maximum iterations (default 200),
<code>d</code>	the truncation point.

Something somewhat unique to the tabbing environment is that you can also add or subtract vertical space at the end of any line by putting in a length in brackets.
